

About BearingPoint

Originally the global IT and business consulting arm of KPMG, it is now established in Europe since its management buyout in 2009. They provide a full service offering – from strategy execution and advisory, through business and technology solution design, build, implementation and support.

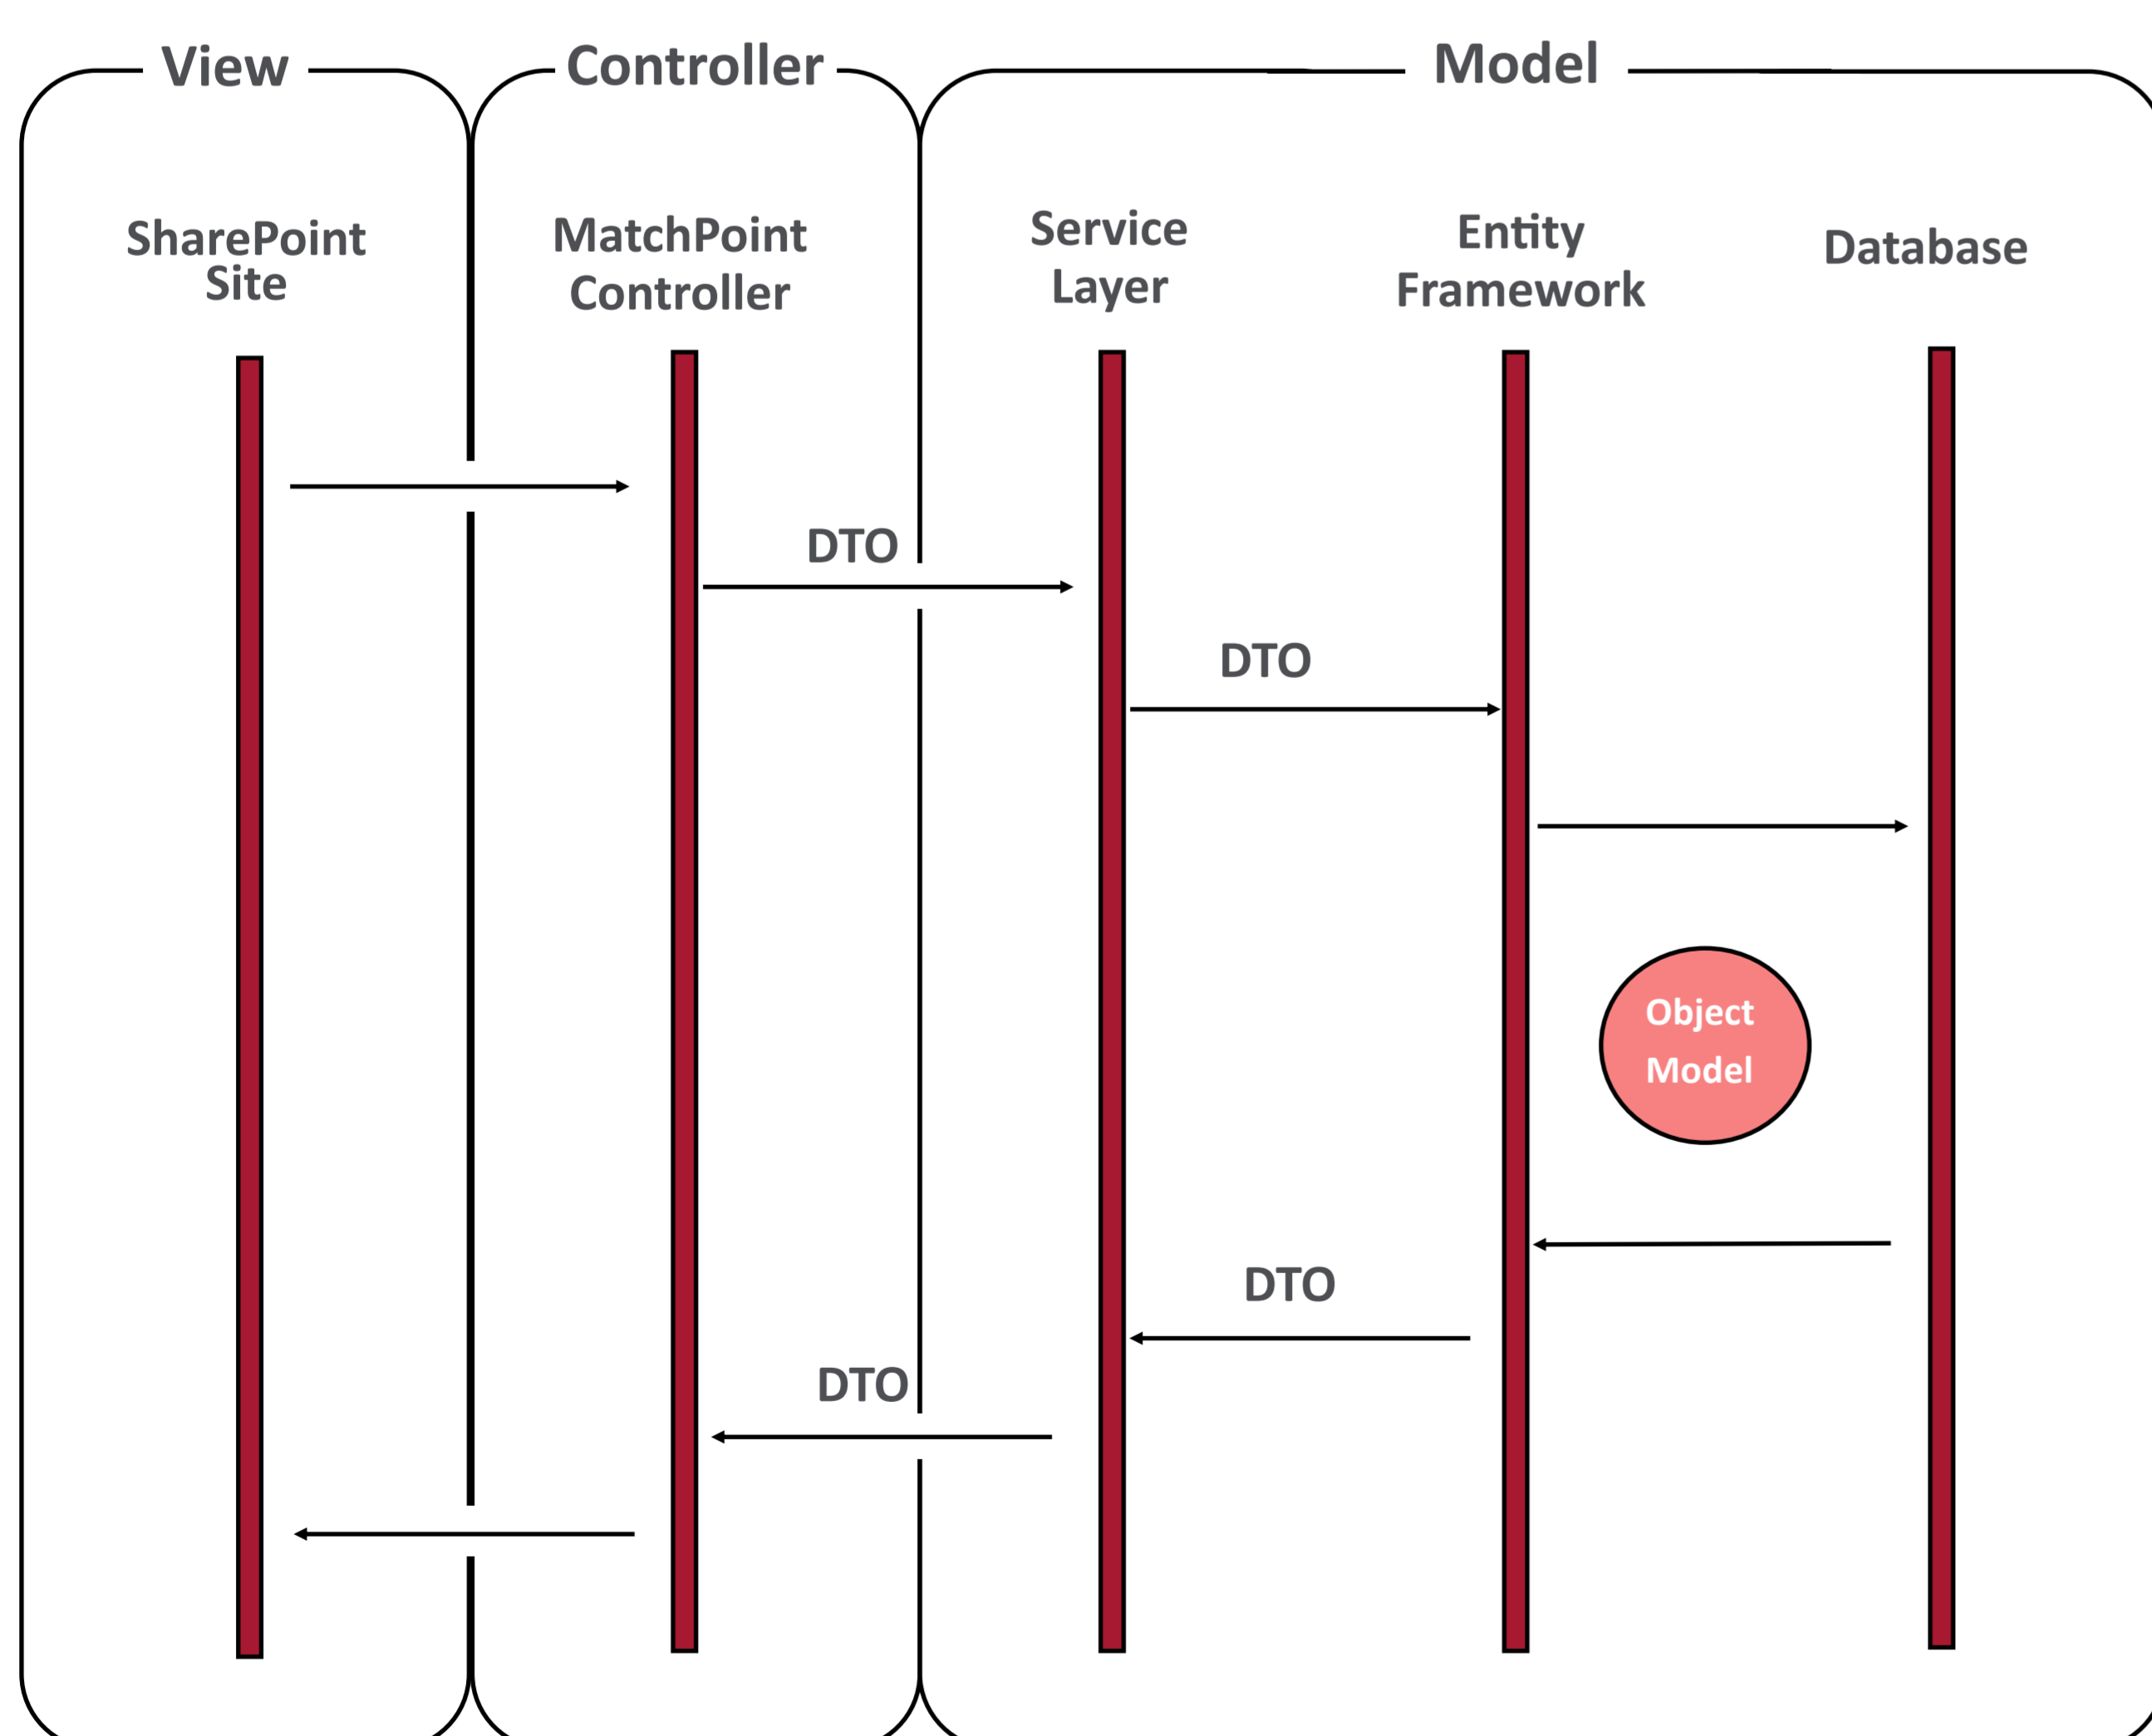

Project

Overview

I was assigned as a core developer on a team of twelve people working on a SharePoint/MatchPoint project. The aim of the project is to deliver a new software solution for a governmental regulatory organisation. This new solution contains the functionality of a number of outdated systems which are currently in use, and updates their data storage and processing capabilities to the latest standards.

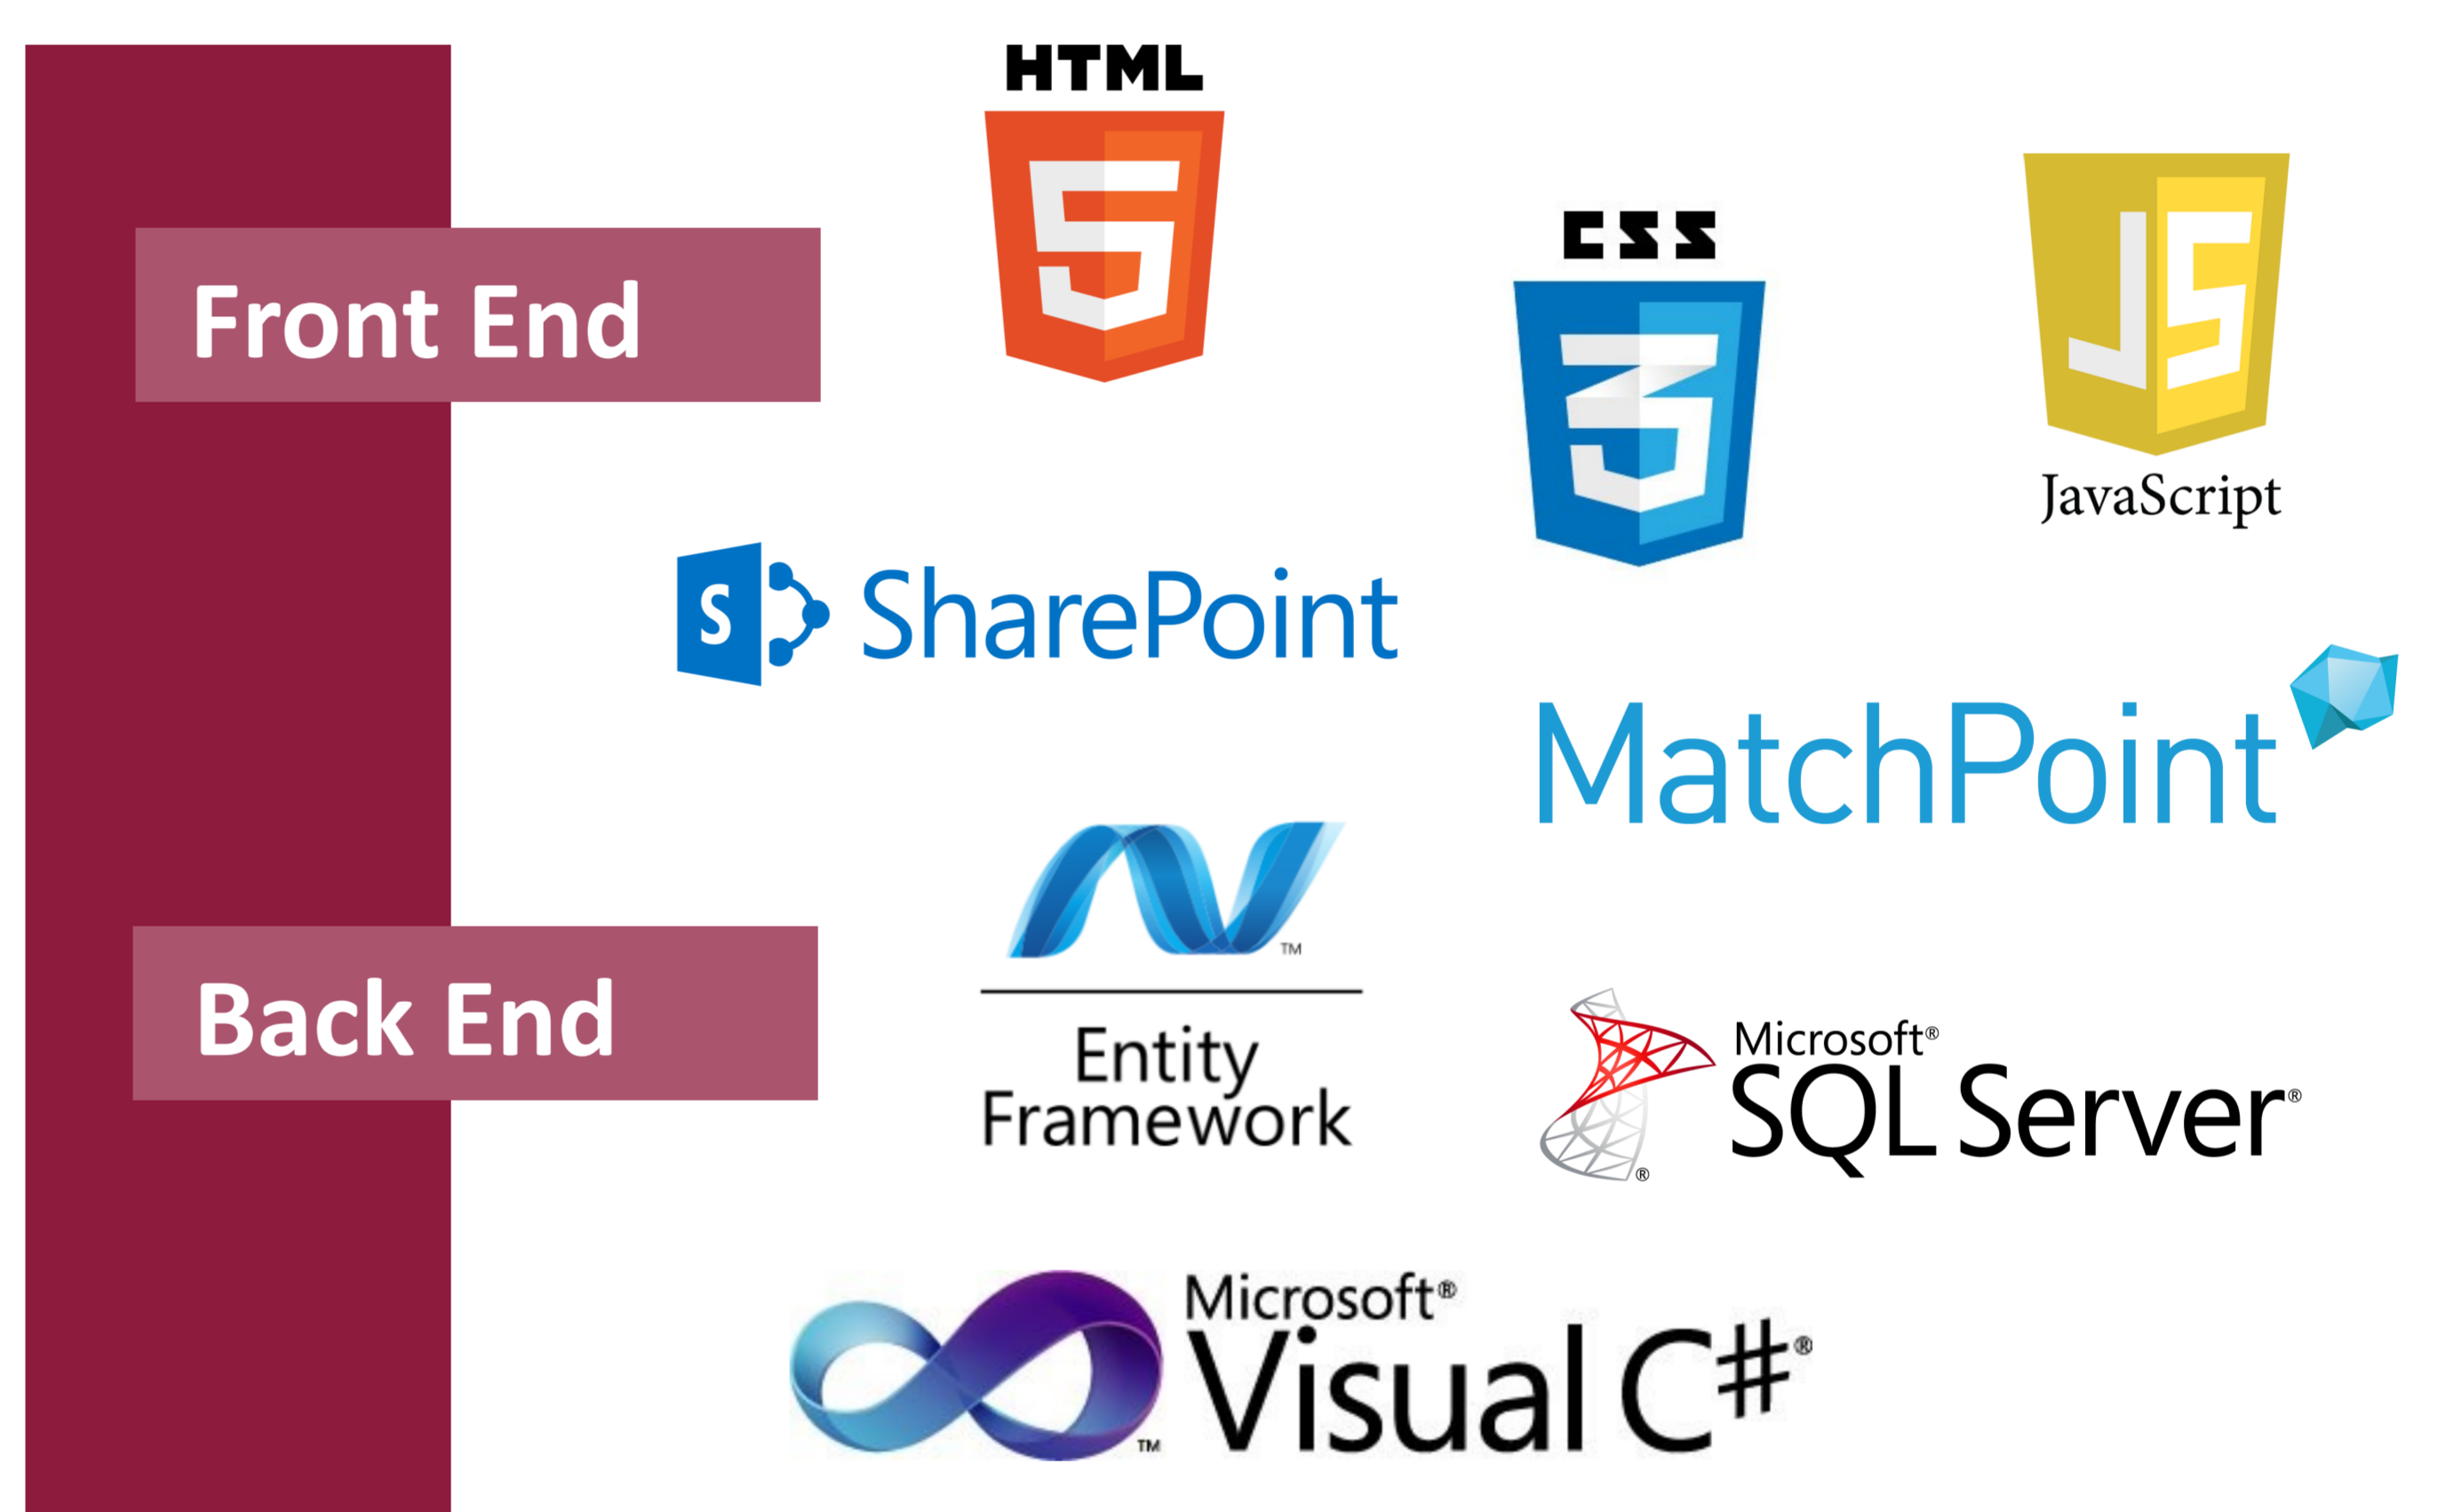

Design & Architectural Patterns

The project follows two very widely used patterns: The MVC architectural pattern, and the Service Layer design pattern.

The UI is implemented using MatchPoint with DTOs being used to transfer data between the front end and the object model.

Technologies

Learning Opportunities

Experience

The chance to work on a team of individuals of varying backgrounds and skills and to gain first hand experience with regards to team management and inter-team communication.

Training

An abundance of courses for personal and technical development such as business writing, time management and presentation skills.
