**Learning Outcomes**

Students who complete this module should be able to:

- DS2LO1 Describe the principle types of algorithm that form the basis of data science methods;
- DS2LO2 Explain the properties of these algorithms that will or will not permit scalability;
- DS2LO3 Choose the appropriate software and hardware tools to implement these algorithms in any specific case.

**Module Learning Aims**

The aims of this module are to give the student skills to address the principal computational challenges that are encountered when trying to scale statistical algorithms:

- Convex optimization: convexity, subgradient methods, duality.
- Co-ordinate descent methods, asynchronous updating.
- Introduction to non-convex optimisation: convex-concave approach
- Linear programming
- Matrix factorisation and decomposition,
- Large-dimension simulation: Gibbs sampling, annealing methods
- Overview of Programming: Python, R for big data, Map-reduce/Hadoop, Scala.

**Assessment Details**

- Coursework: 20%
- Exam: 80%

The coursework is a project.
