### Learning Outcomes
On successful completion of this module a student should be able to:
- IS1LO1 Compare and contrast different approaches to modelling information and knowledge (ISLO2)
- IS1LO2 Model information and produce rich semantic models and ontologies (ISLO1, ISLO4)
- IS1LO3 Describe how formal models that underlie meta-data enabled inference and reasoning
- IS1LO4 Survey the state of the art in semantic technologies and applications
- IS1LO5 Demonstrate a clear understanding of the principles underlying information interoperability and transformation.
- IS1LO6 Apply information interoperability and transformation techniques to a range of applied problems.
- IS1LO7 Use sophisticated querying approaches to facilitate distributed information retrieval and aggregation

### Module Learning Aims
The module is designed to explore the management, delivery and inter-operability of information through knowledge and data engineering. The module is not a typical database or information management module, but rather encourages students to perceive the challenges, technologies and solutions, in handling distributed, multi modal, heterogeneous information and knowledge models and using those models to drive adaptation within applications and systems.

The module focuses on advanced technologies (in particular semantic web technologies), to provide adaptive, agile handling of heterogeneous, ubiquitous information. The module includes such areas as integration of heterogeneous information repositories, schema (RDF) and semantic (e.g. ontology) representation and querying.

The main themes of the module are:
- Managing, integrating and transforming disparate information from heterogeneous sources
- Representing, managing, and reasoning about semantics of information (and services)
- Using information and knowledge models to drive adaptation within applications and systems

### Module Content
Specific topics addressed in this module include:
- Semantic Web
- Linked Data
- Semantic Model Design
- Representing Semantics in metadata
- Semantic based querying in a distributed environment
- Semantic based reasoning
- Semantic Interoperability
- Schema Mapping

### Recommended Reading List
Programming the Semantic Web, by T. Segaran, C. Evans and J. Taylor, O'Reilly 2009
